Live Gemini Verification — Successful Retest

Project: P27 · COMP3888_M17_02_ZL
Date: 26 October 2026 (Australia/Sydney)
Model: gemini-3.8-flash
Outcome: 5 passed, 0 failed, 0 skipped. Three tests used real Gemini; two used deterministic HTTP fixtures.

Real-provider results

Scenario	Result	Test duration	What was verified
General conversation	PASS	2.10 s	Answers a synthetic port question through the actual provider and HTTP router.
Complete body rewrite	PASS	2.70 s	Returns a validated nonempty replacement up to 12,000 characters with server-owned original text.
Unsaved-draft consistency	PASS	3.92 s	Receives the supplied draft and selected published reference; returns a usable answer.

Durations are single test observations including HTTP/context/provider work, not a latency benchmark or SLA. Total test-run time was 8.95 seconds.

Observed reply content

The ordinary answer states that ships may enter only during the day. In the consistency reply, the model identified midnight entry as a clear conflict with the absolute night-entry ban, cited Harbour Regulations (ID 3, version 2), suggested daylight arrival or waiting offshore, and limited its conclusion to supplied context. This is a qualitative review of one recorded synthetic response, not a repeated accuracy evaluation.

The body-edit test validates response plumbing and replacement shape/length; its log does not preserve the full replacement for independent semantic review. No broad claim about rewrite quality is made.

Relationship to the baseline report

This successful retest supersedes the earlier blocked/failed connection status for these three smoke scenarios. The main report now integrates this successful run alongside its original deterministic baseline; historical skipped results are retained and the later real-provider passes are shown separately. Earlier API-key errors, timeouts and service-error evidence are retained. No cause for the difference between keys/accounts is inferred.

The broader five-scenario, repeated AI quality assessment and client acceptance remain outstanding. The registration-email defect and contrast finding from the baseline are unchanged.

Evidence and reproduction

Evidence: `live-ai-latest.tap`, `live-ai-latest.junit.xml` and `live-ai-success-summary.json` in `testing/evidence/`. Only synthetic content was sent; no application data or business code was modified and no key value is recorded.

From `backend/`, with the local key configured:

```
AI_LIVE_SMOKE=1 AI_LIVE_EDIT_SMOKE=1 node --test test/assistant-http.test.js
```
